Dive into Deep Learning in 1 Day

1 Basics · 2 Convnets · 3 Computation · 4 Sequences

AMLC 2019

Mu Li and Alex Smola
http://amlc-d2l.corp.amazon.com/

aws

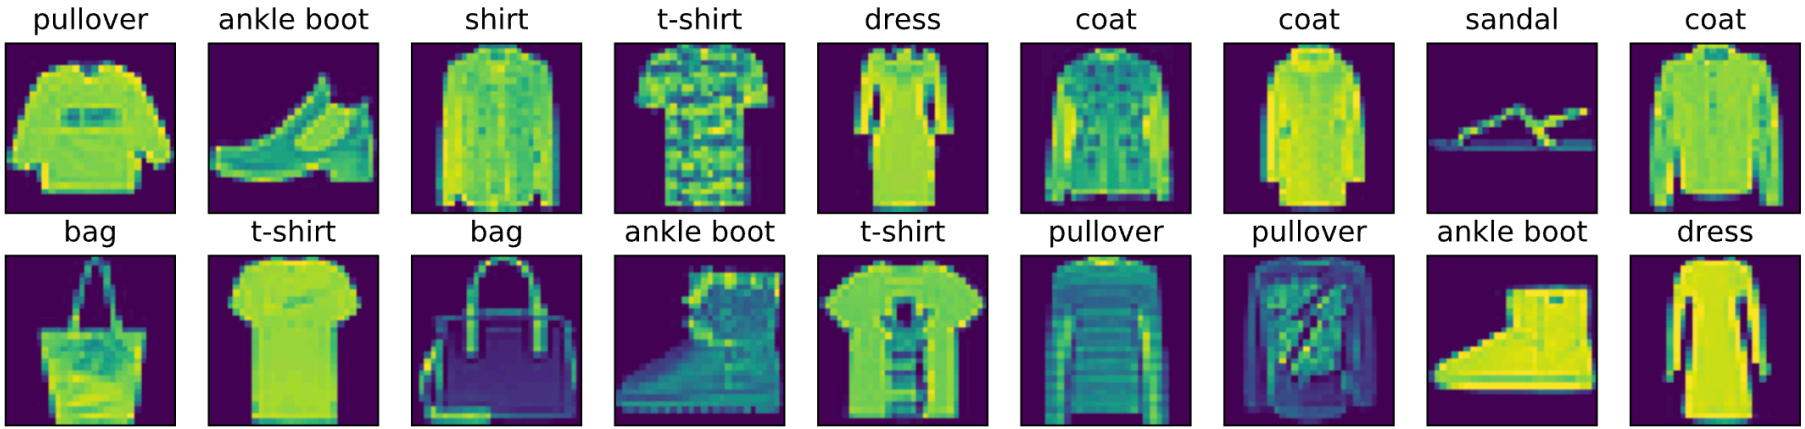
Outline

- Sequence models and language models
- Recurrent neural networks (RNN)
- GRU and LSTM
- Deep RNNs, Bi-RNNs

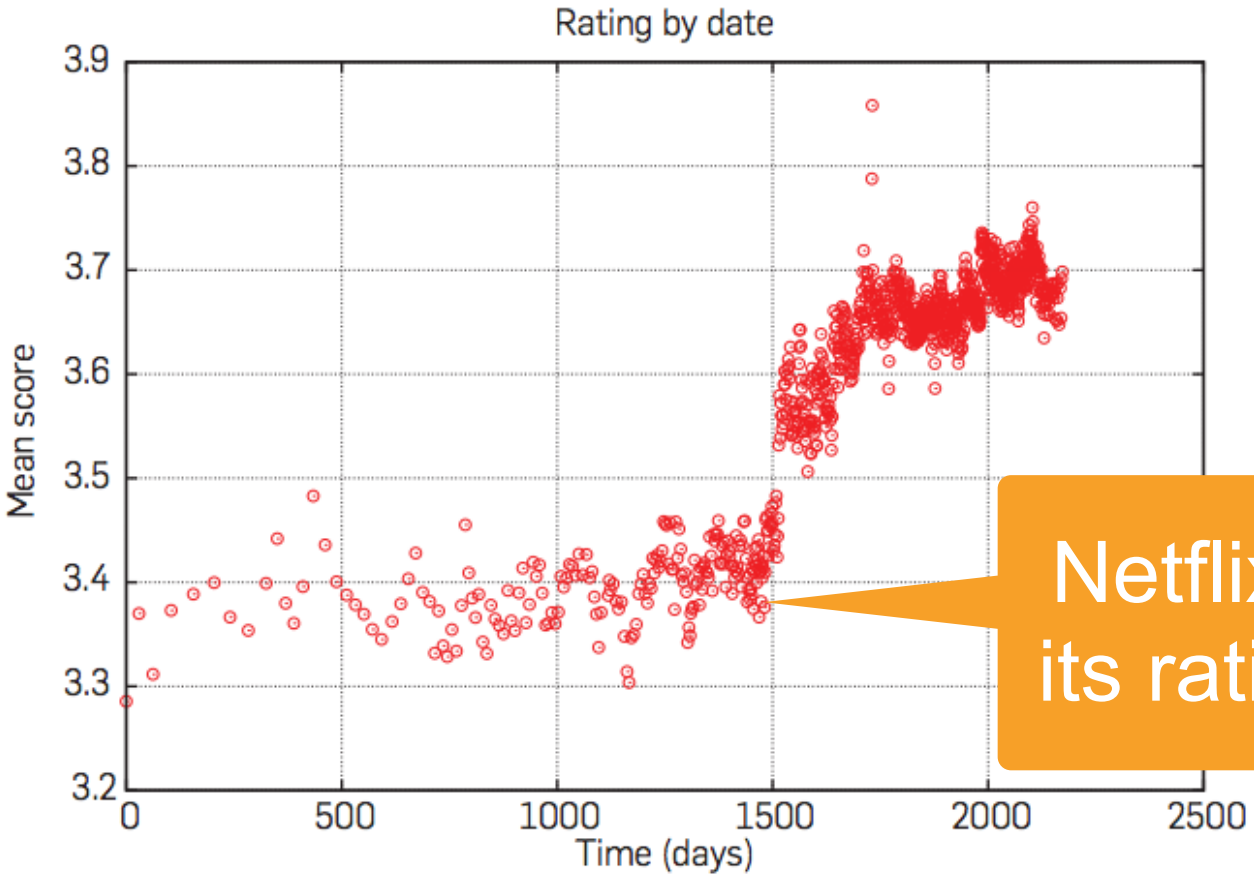
Dependent Random Variables

Data

- So far, collect observation pairs (x_i, y_i) for training
- Assume examples are independent and identically distributed (IID)
  The order of the data does not matter



Time matters (Koren, 2009)



Netflix changed its rating system

Language Models

http://amlc-d2l.corp.amazon.com/

Language Modeling

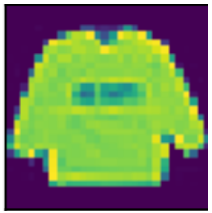
- Goal: predict the probability of a sentence, e.g.

$$p(\text{Deep}, \text{learning}, \text{is}, \text{fun}, .)$$

- A fundamental task in Natural Language Processing
  - Typing - predict the next word
  - Machine translation - `dog bites man` vs `man bites dog`
  - Speech recognition
    `to recognize speech` vs `to wreck a nice beach`

Text Preprocessing

- Sequence data has long dependency (very costly)
- Truncate into shorter fragments
- Transform examples into mini-batches with ndarrays



(batch size, width, height, channel)

```
The Time Traveller (for so it will be
was expounding a recondite matter to u
twinkled, and his usually pale face wa
fire burned brightly, and the soft rad
lights in the lilies of silver caught
passed in our glasses. Our chairs, bei
caressed us rather than submitted to b
luxurious after-dinner atmosphere when
free of the trammels of precision. And
```

(batch size, sentence length)

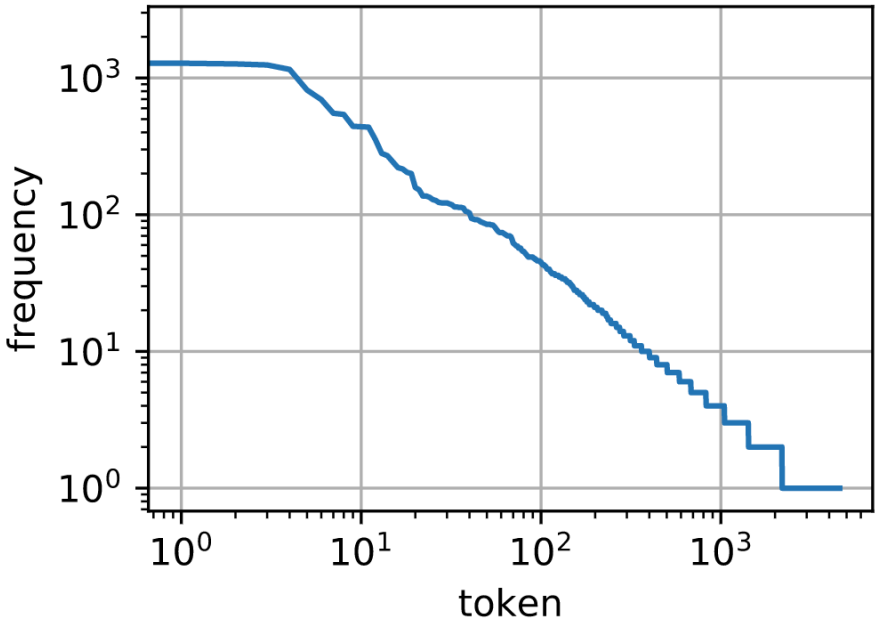
http://amlc-d2l.corp.amazon.com/

Tokenization

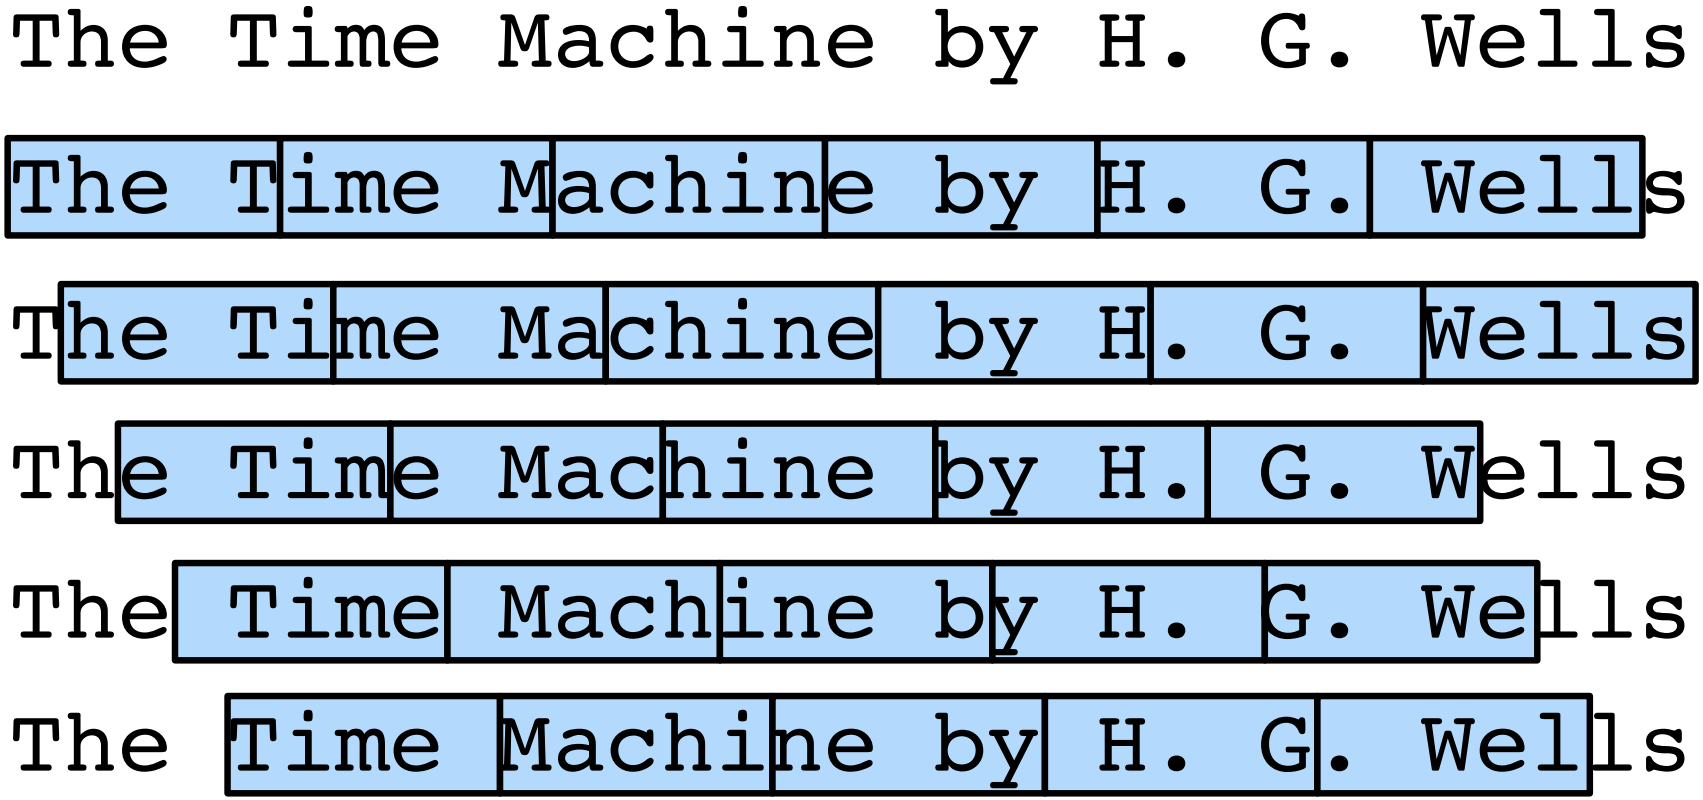
- Basic Idea - map text into sequence of tokens
  - “Deep learning is fun” -> [“Deep”, “learning”, “is”, “fun”, “.”]
- **Character Encoding** (each character as a token)
  - Small vocabulary
  - Doesn’t work so well (needs to learn spelling)
- **Word Encoding** (each word as a token)
  - Accurate spelling
  - Doesn’t work so well (huge vocabulary = costly multinomial)
- **Byte Pair Encoding** (Goldilocks zone)
  - Frequent subsequences (like syllables)

Vocabulary

- Find unique tokens, map each one into a numerical index
  - “Deep” : 1, “learning” : 2, “is” : 3, “fun” : 4, “.” : 5
- The frequency of words often obeys a power law distribution
  - Map the tailing tokens, e.g. appears < 5 times, into a special “unknown” token



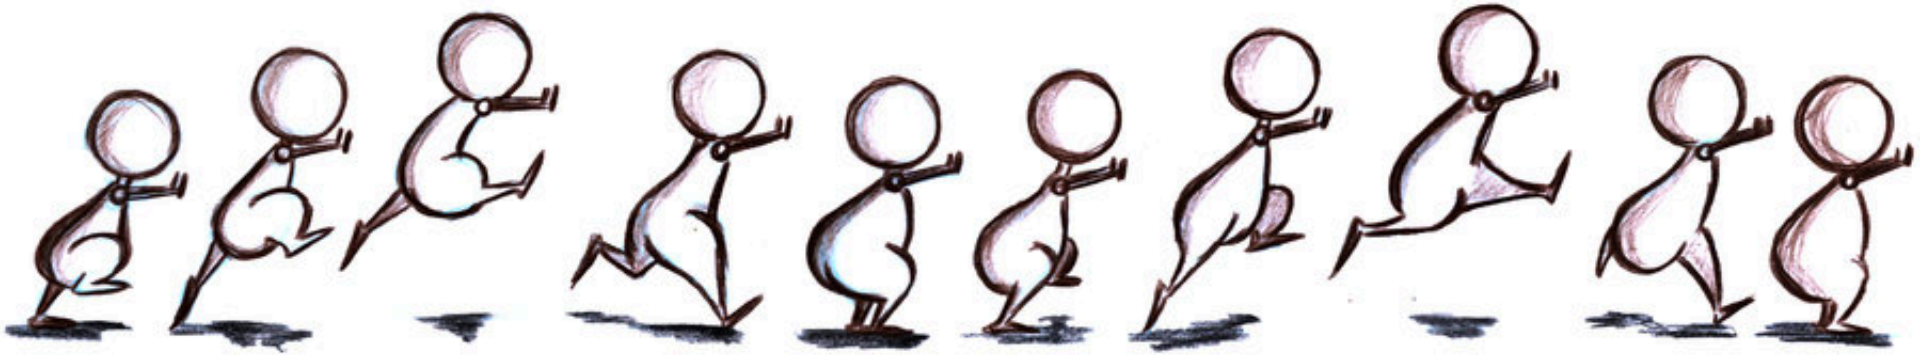
Minibatch Generation



Text Preprocessing Notebook

http://amlc-d2l.corp.amazon.com/

Sequence Models



http://amlc-d2l.corp.amazon.com/

aws

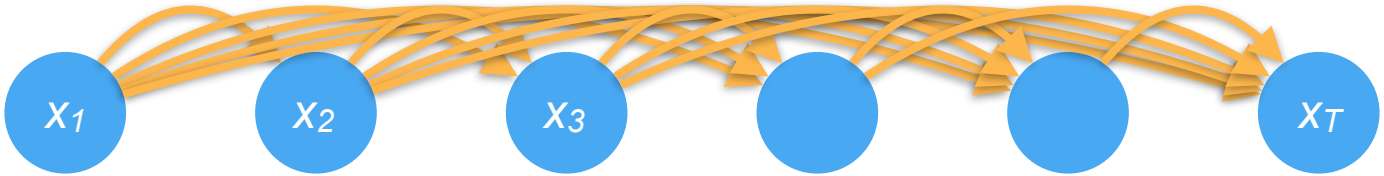
Sequence Model

- Dependent random variables

$$(x_1, \ldots x_T) \sim p(\mathbf{x})$$

- Conditional probability expansion

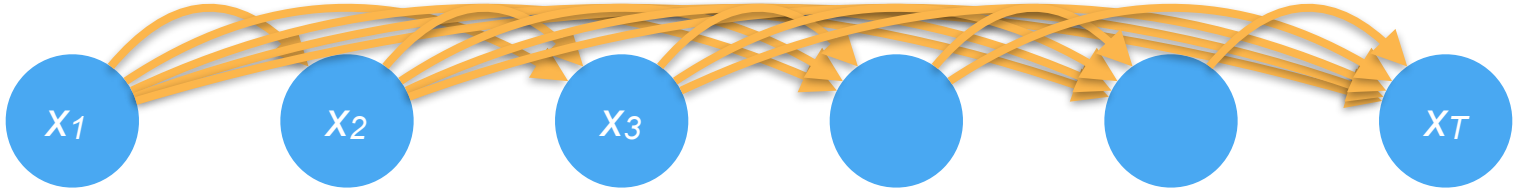
$$p(\mathbf{x}) = p(x_1) \cdot p(x_2 \mid x_1) \cdot p(x_3 \mid x_1, x_2) \cdot \ldots \cdot p(x_T \mid x_1, \ldots x_{T-1})$$



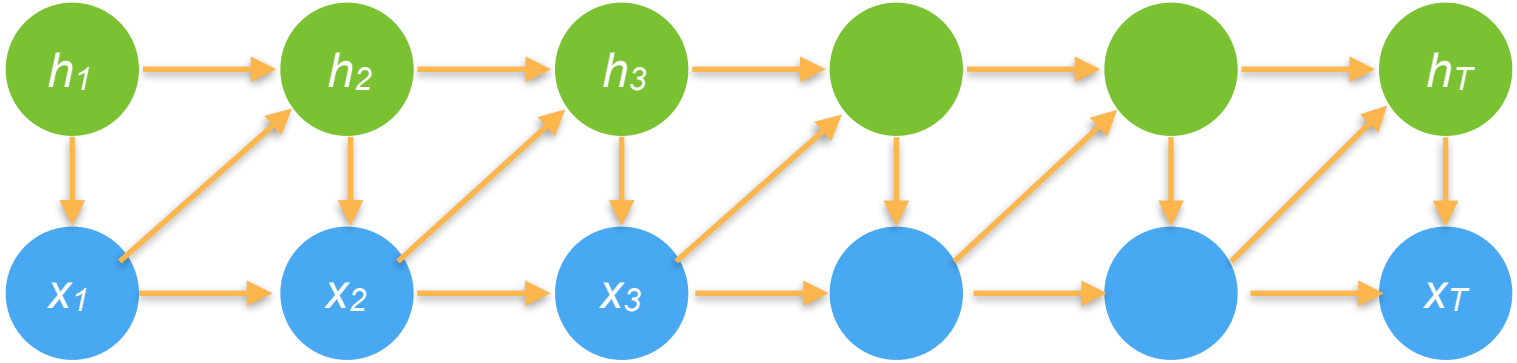
Exponential complexity!

Latent Variable Model

$$p(x) = p(x_1) \cdot p(x_2 \mid x_1) \cdot p(x_3 \mid x_1, x_2) \cdot \ldots \cdot p(x_T \mid x_1, \ldots x_{T-1})$$



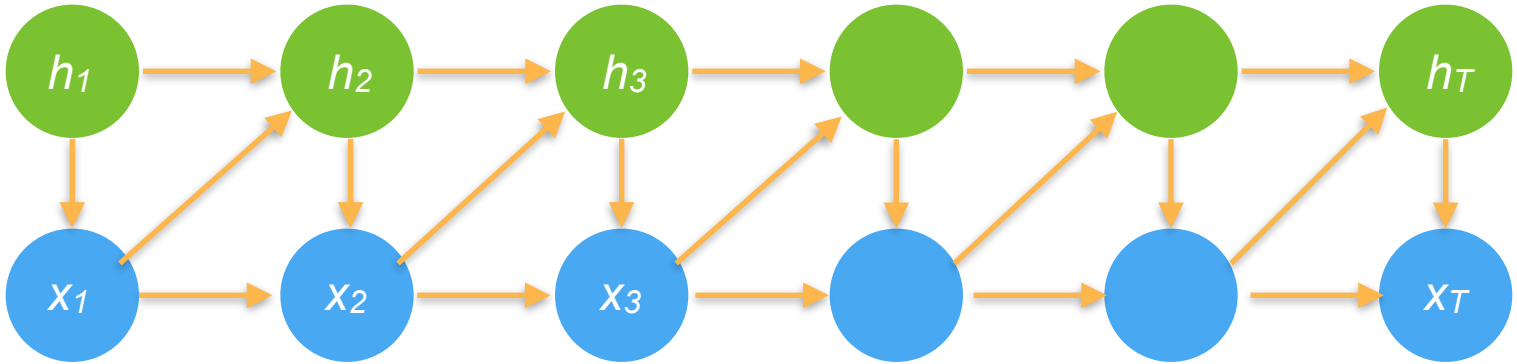
$p(h_t \mid h_{t-1}, x_{t-1})$ and $p(x_t \mid h_t, x_{t-1})$

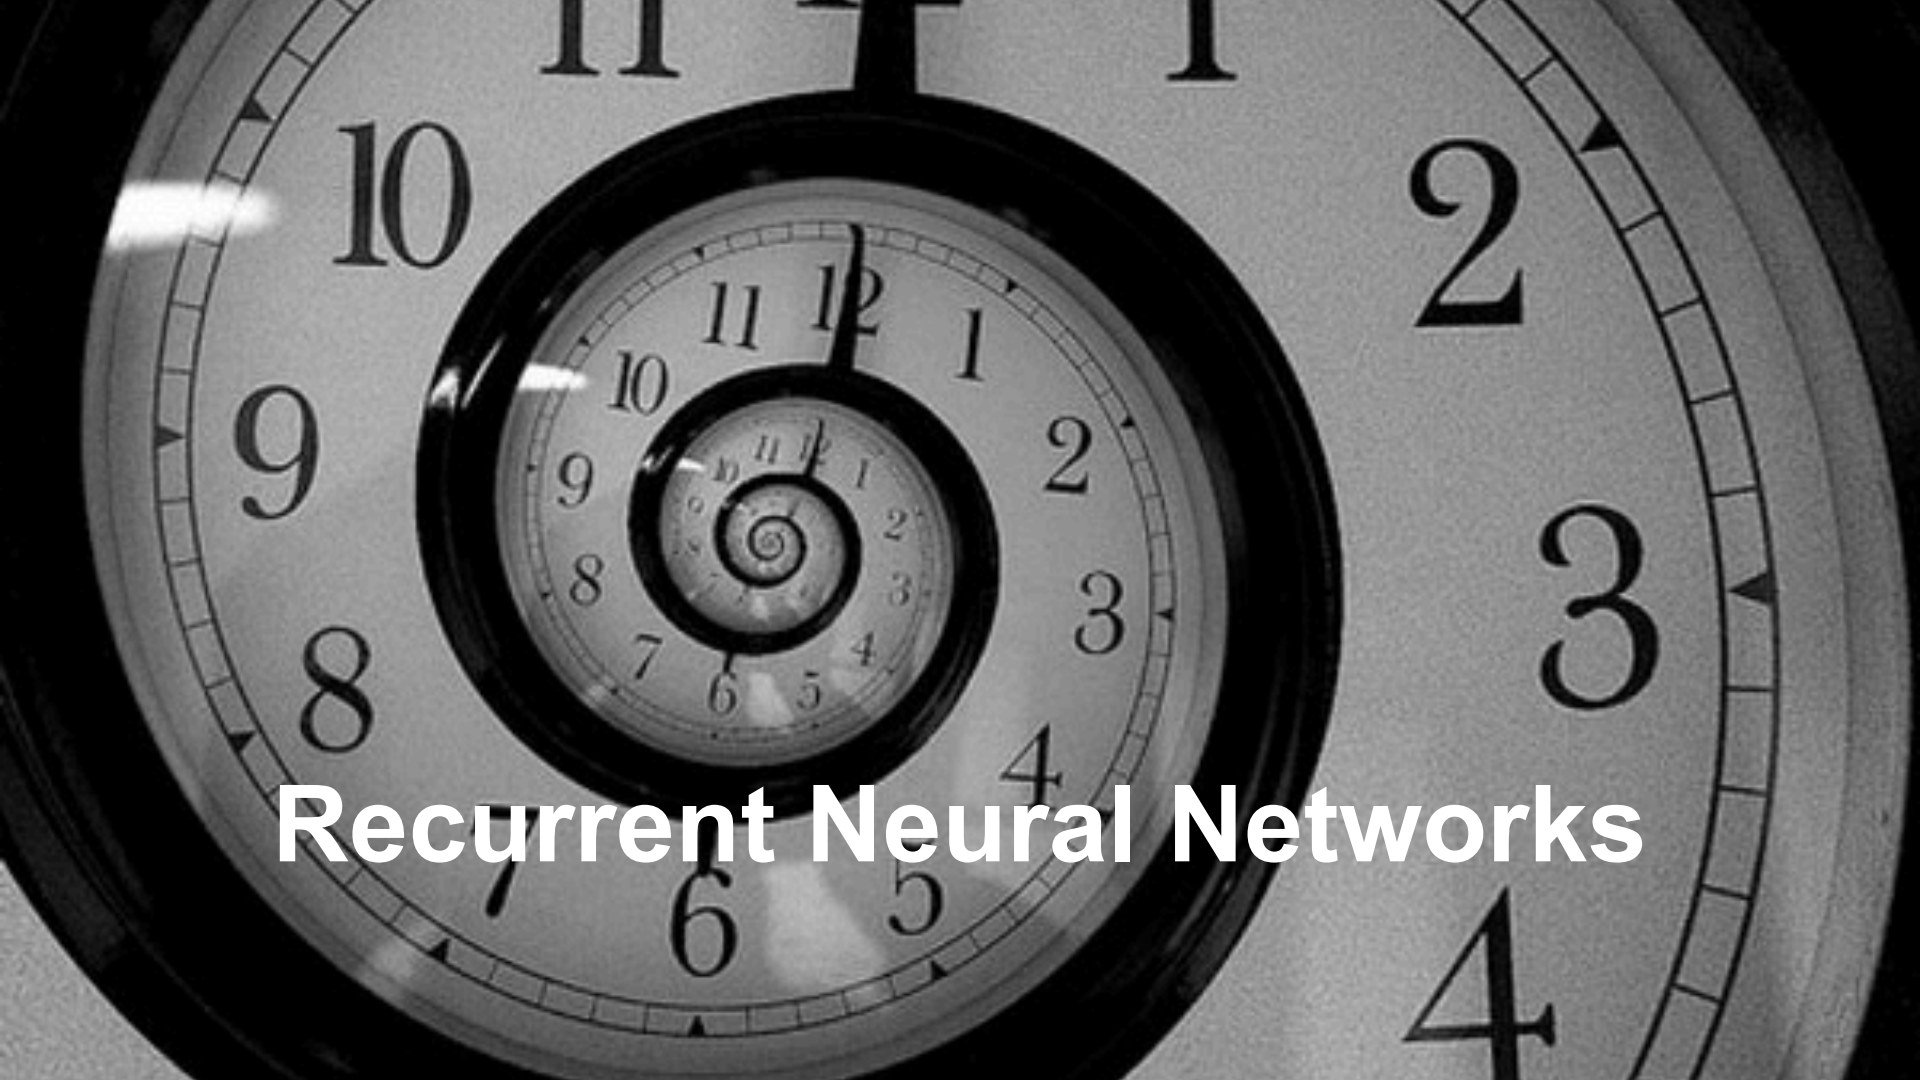


Latent Variable Model

- Latent state summarizes all the relevant information about the past. So we get $h_t = f(x_1, \ldots x_{t-1}) = f(h_{t-1}, x_{t-1})$

$p(h_t \mid h_{t-1}, x_{t-1})$ and $p(x_t \mid h_t, x_{t-1})$





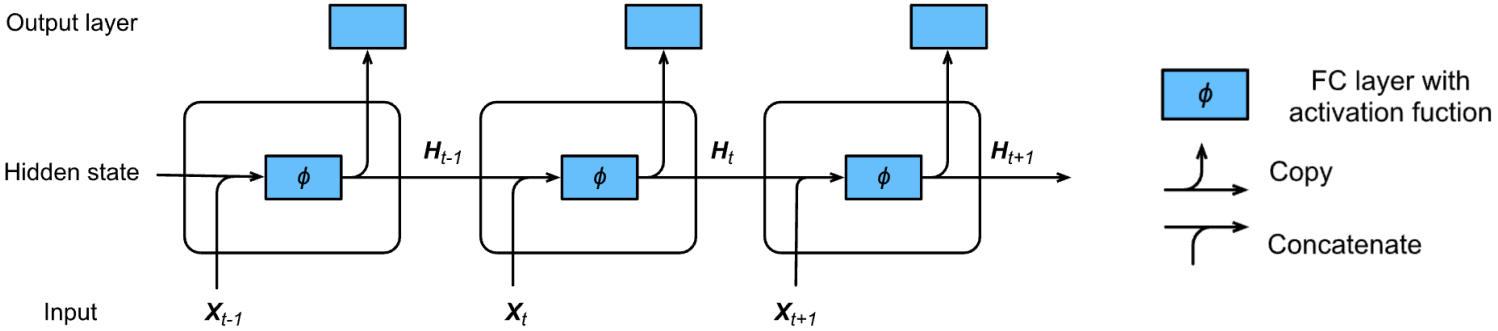
Recurrent Neural Networks

Steps in a Language Model

step	1	2	3	4	5
output					
output state					
hidden state					
input	The	Time	Machine	by	H.

http://amlc-d2l.corp.amazon.com/

Recurrent Networks with Hidden States



- Hidden State update

$$\mathbf{H}_t = \phi(\mathbf{W}_{hh}\mathbf{H}_{t-1} + \mathbf{W}_{hx}\mathbf{X}_{t-1} + \mathbf{b}_h)$$

- Observation update

$$\mathbf{o}_t = \mathbf{W}_{ho}\mathbf{H}_t + \mathbf{b}_o$$

- Compare to MLP

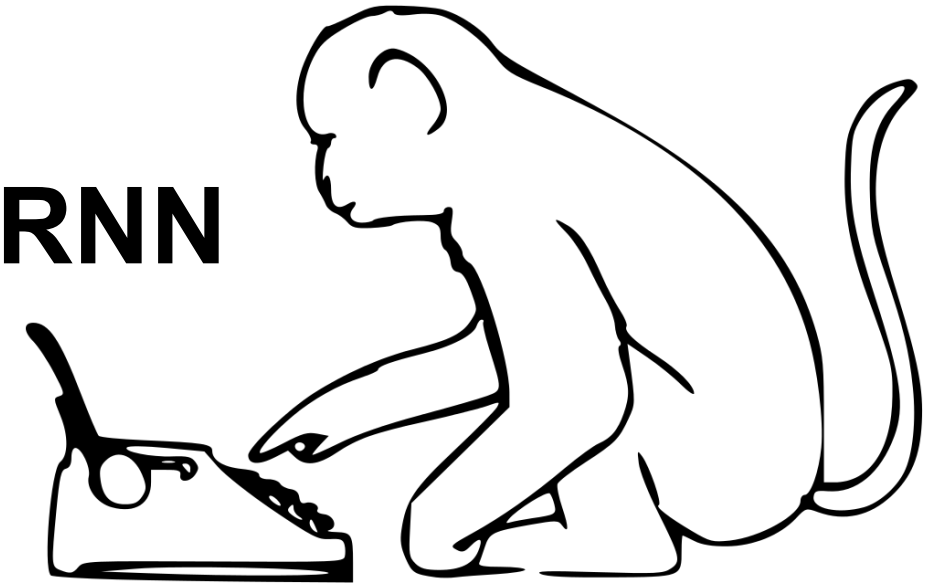
$$\mathbf{H}_t = \phi(\mathbf{W}_{hx}\mathbf{X}_{t-1} + \mathbf{b}_h)$$

$$\mathbf{o}_t = \mathbf{W}_{ho}\mathbf{H}_t + \mathbf{b}_o$$

http://amlc-d2l.corp.amazon.com/

aws

Implementing an RNN Language Model



http://amlc-d2l.corp.amazon.com/

Input Encoding

- Need to map input numerical indices to vectors
  - Pick granularity (words, characters, subwords)
  - Map to indicator vectors

```
npx.one_hot(np.array([0, 2]), len(vocab))
```

```
array([[1., 0., 0., 0., 0., 0., 0., 0., 0., 0.,
        0., 0., 0., 0., 0., 0., 0., 0., 0., 0.,
       [0., 0., 1., 0., 0., 0., 0., 0., 0., 0.,
        0., 0., 0., 0., 0., 0., 0., 0., 0., 0.,
```

RNN with hidden state mechanics

- Input: vector sequence $\mathbf{x}_1, \ldots, \mathbf{x}_T \in \mathbb{R}^d$
- Hidden states: $\mathbf{h}_1, \ldots, \mathbf{h}_T \in \mathbb{R}^h$ where $\mathbf{h}_t = f(\mathbf{h}_{t-1}, \mathbf{x}_t)$
- Output: vector sequence $\mathbf{o}_1, \ldots, \mathbf{o}_T \in \mathbb{R}^p$ where $\mathbf{o}_t = g(\mathbf{h}_t)$
  - *p* is the vocabulary size
  - $\mathbf{o}_{t,j}$ is confident score that the *t*-th token in the sequence equals to *j*-th token in the vocabulary
- Loss: measure the classification error on *T* tokens

Perplexity

- Typically measure accuracy with log-likelihood
  - This makes outputs of different length incomparable (e.g. bad model on short output has higher likelihood than excellent model on very long output)
  - Normalize log-likelihood to sequence length

$$-\sum_{t=1}^{T} \log p(y_t | \text{model}) \quad \text{vs.} \quad \pi := -\frac{1}{T}\sum_{t=1}^{T} \log p(y_t | \text{model})$$

- Perplexity is exponentiated version $\exp(\pi)$ (effectively number of possible choices on average)

Gradients

- Long chain of dependencies for backprop
  - Need to keep a lot of intermediate values in memory
  - Butterfly effect style dependencies
  - Gradients can vanish or diverge
- Clipping to prevent divergence

$$\mathbf{g} \leftarrow \min\left(1, \frac{\theta}{\|\mathbf{g}\|}\right)\mathbf{g}$$

rescales to gradient of size at most θ

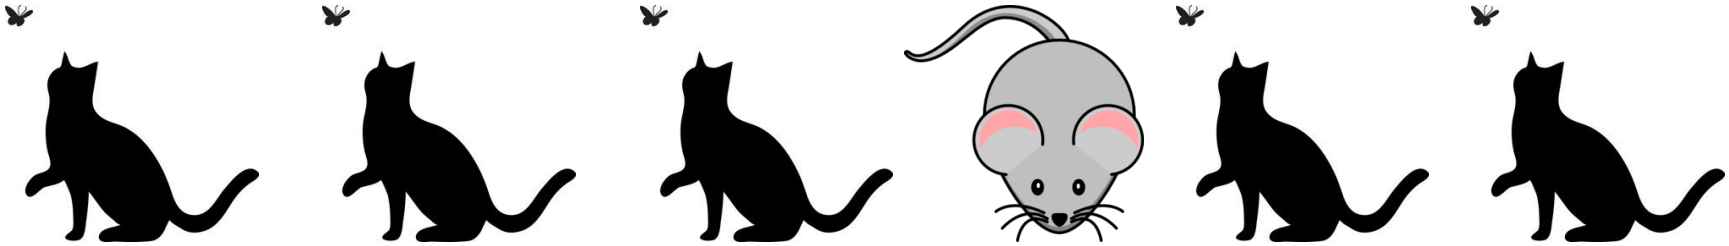
RNN Notebook

http://amlc-d2l.corp.amazon.com/

Gated Recurrent Unit (GRU)

Paying attention to a sequence

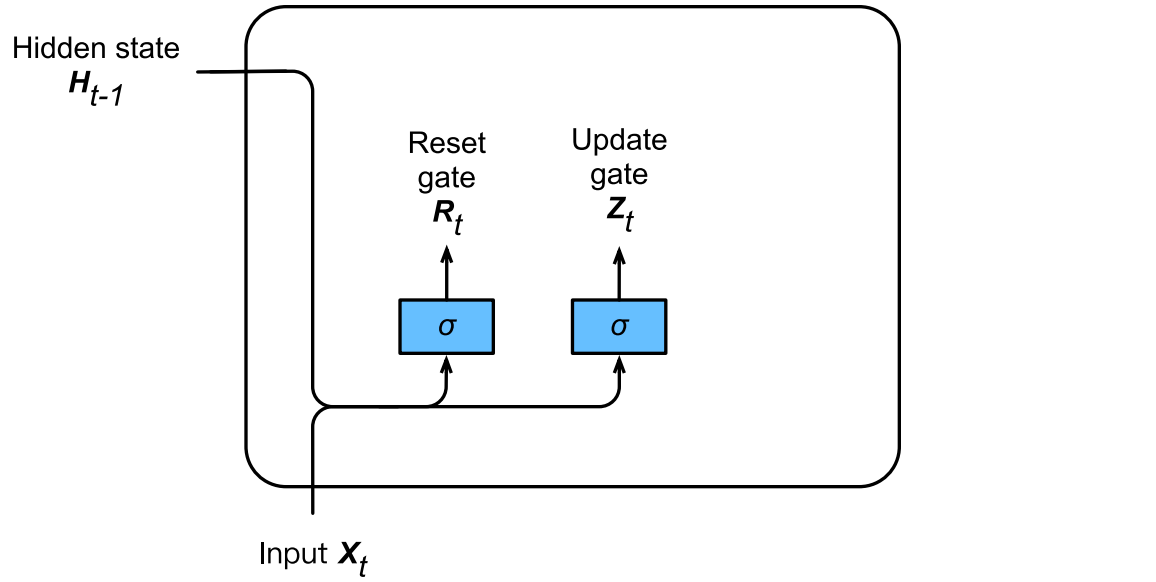
- Not all observations are equally relevant



- Only remember the relevant ones
  - Need mechanism to **pay attention (update gate)**
  - Need mechanism to **forget (reset gate)**

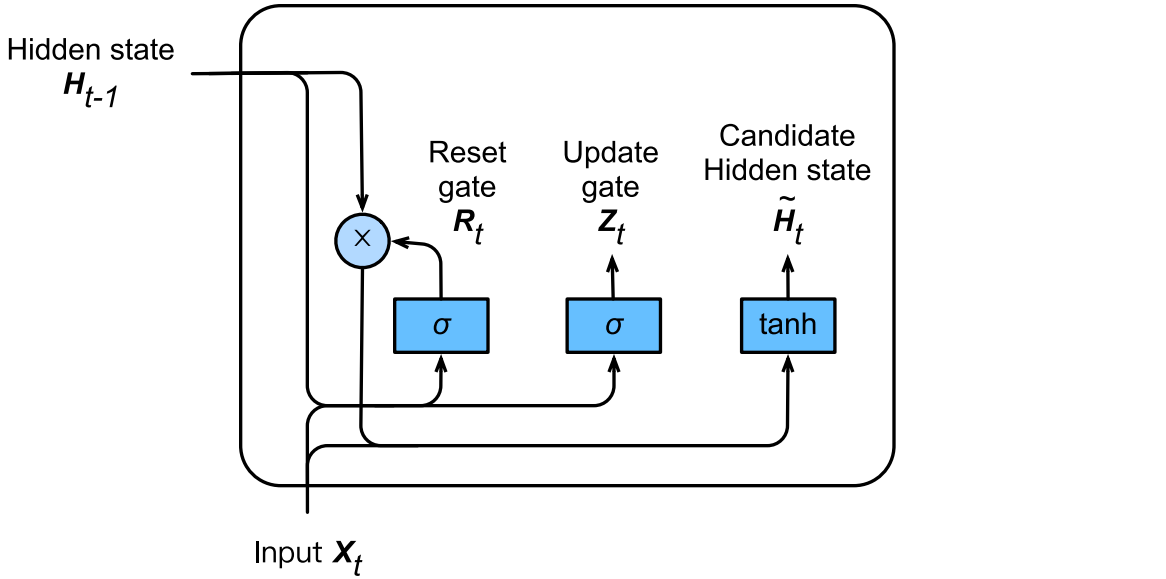
Gating

$$\boldsymbol{R}_t = \sigma(\boldsymbol{X}_t \boldsymbol{W}_{xr} + \boldsymbol{H}_{t-1} \boldsymbol{W}_{hr} + \boldsymbol{b}_r),$$
$$\boldsymbol{Z}_t = \sigma(\boldsymbol{X}_t \boldsymbol{W}_{xz} + \boldsymbol{H}_{t-1} \boldsymbol{W}_{hz} + \boldsymbol{b}_z)$$



Candidate Hidden State

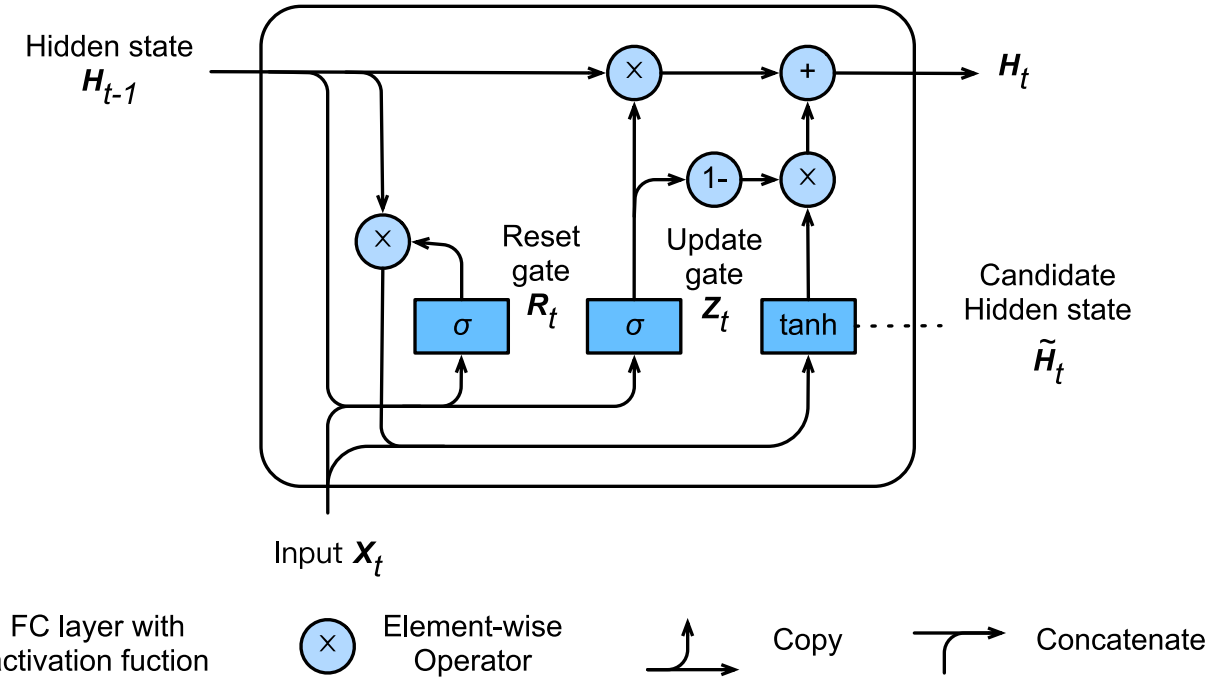
$$\tilde{\boldsymbol{H}}_t = \tanh(\boldsymbol{X}_t \boldsymbol{W}_{xh} + \left(\boldsymbol{R}_t \odot \boldsymbol{H}_{t-1}\right) \boldsymbol{W}_{hh} + \boldsymbol{b}_h)$$



http://amlc-d2l.corp.amazon.com/

Hidden State

$$\boldsymbol{H}_t = \boldsymbol{Z}_t \odot \boldsymbol{H}_{t-1} + (1 - \boldsymbol{Z}_t) \odot \tilde{\boldsymbol{H}}_t$$



http://amlc-d2l.corp.amazon.com/

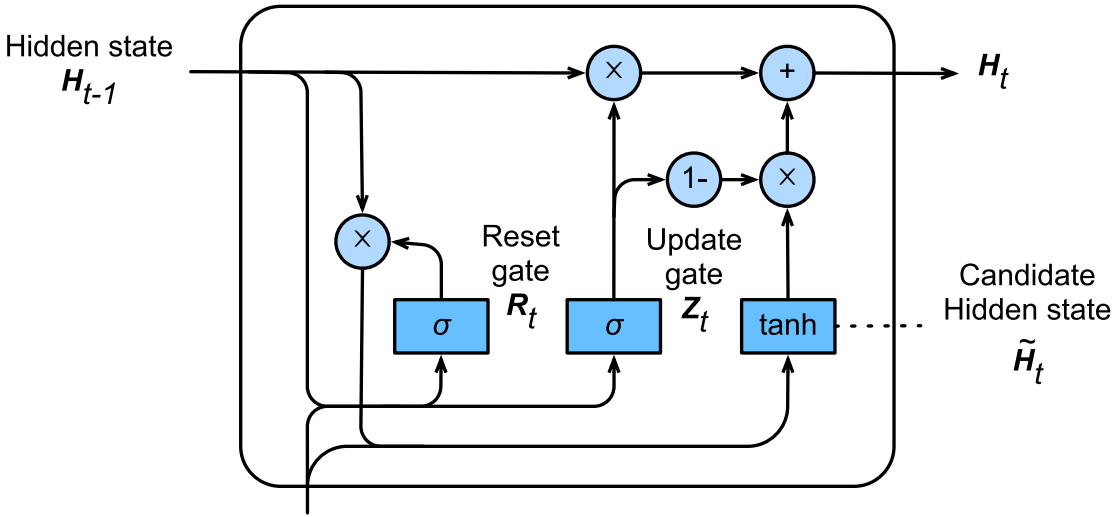
Summary

$$\boldsymbol{R}_t = \sigma(\boldsymbol{X}_t \boldsymbol{W}_{xr} + \boldsymbol{H}_{t-1} \boldsymbol{W}_{hr} + \boldsymbol{b}_r),$$

$$\boldsymbol{Z}_t = \sigma(\boldsymbol{X}_t \boldsymbol{W}_{xz} + \boldsymbol{H}_{t-1} \boldsymbol{W}_{hz} + \boldsymbol{b}_z)$$

$$\tilde{\boldsymbol{H}}_t = \tanh(\boldsymbol{X}_t \boldsymbol{W}_{xh} + (\boldsymbol{R}_t \odot \boldsymbol{H}_{t-1}) \boldsymbol{W}_{hh} + \boldsymbol{b}_h)$$

$$\boldsymbol{H}_t = \boldsymbol{Z}_t \odot \boldsymbol{H}_{t-1} + (1 - \boldsymbol{Z}_t) \odot \tilde{\boldsymbol{H}}_t$$

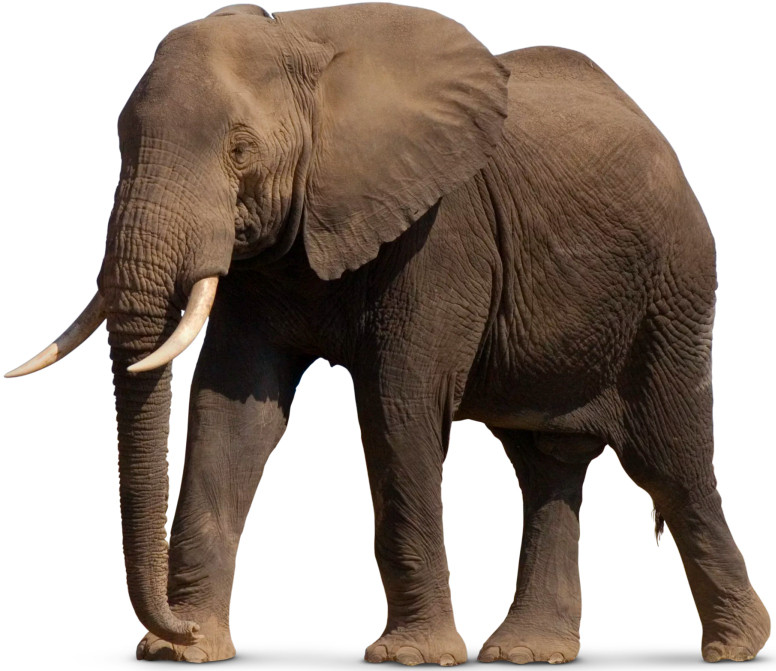


http://amlc-d2l.corp.amazon.com/

GRU Notebook

http://amlc-d2l.corp.amazon.com/

Long Short Term Memory



http://amlc-d2l.corp.amazon.com/

Long Short Term Memory

- **Forget gate**
  Shrink values towards zero
- **Input gate**
  Decide whether we should ignore the input data
- **Output gate**
  Decide whether the hidden state is used for the output generated by the LSTM

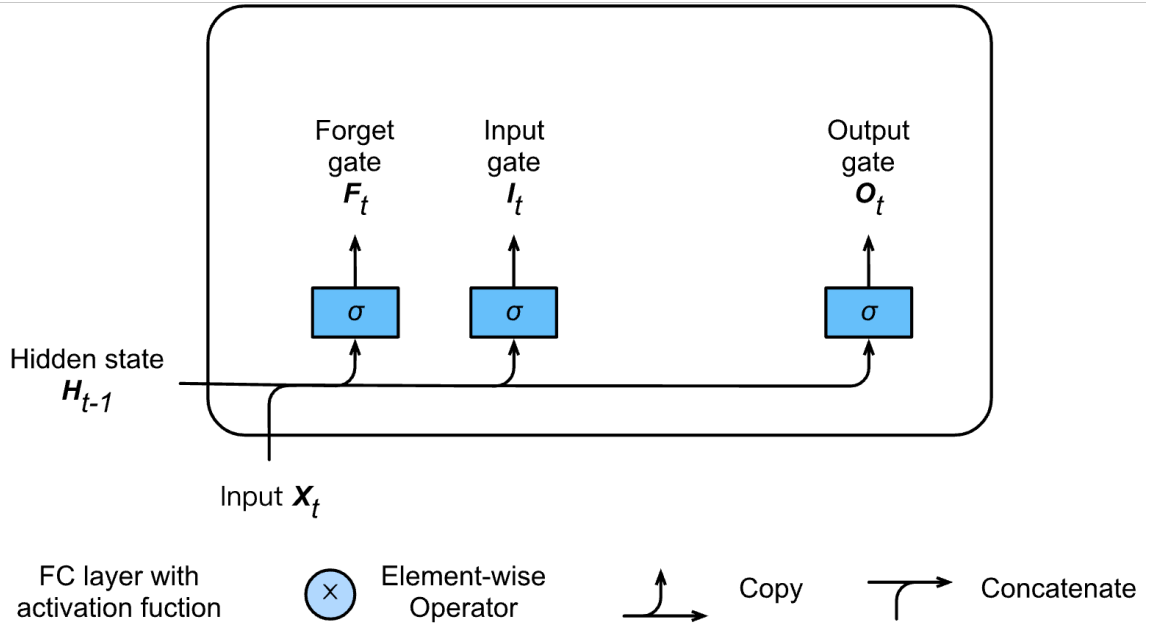
- **Hidden state** and **Memory cell**

Gates

$$\boldsymbol{I}_t = \sigma(\boldsymbol{X}_t \boldsymbol{W}_{xi} + \boldsymbol{H}_{t-1} \boldsymbol{W}_{hi} + \boldsymbol{b}_i)$$

$$\boldsymbol{F}_t = \sigma(\boldsymbol{X}_t \boldsymbol{W}_{xf} + \boldsymbol{H}_{t-1} \boldsymbol{W}_{hf} + \boldsymbol{b}_f)$$

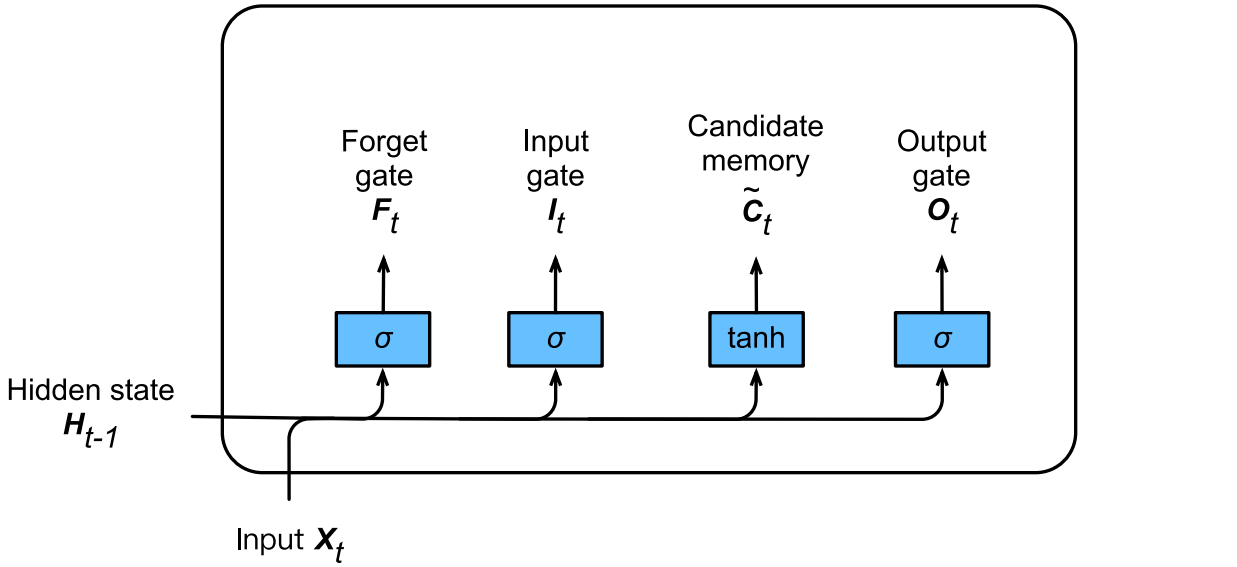
$$\boldsymbol{O}_t = \sigma(\boldsymbol{X}_t \boldsymbol{W}_{xo} + \boldsymbol{H}_{t-1} \boldsymbol{W}_{ho} + \boldsymbol{b}_o)$$



http://amlc-d2l.corp.amazon.com/

Candidate Memory Cell

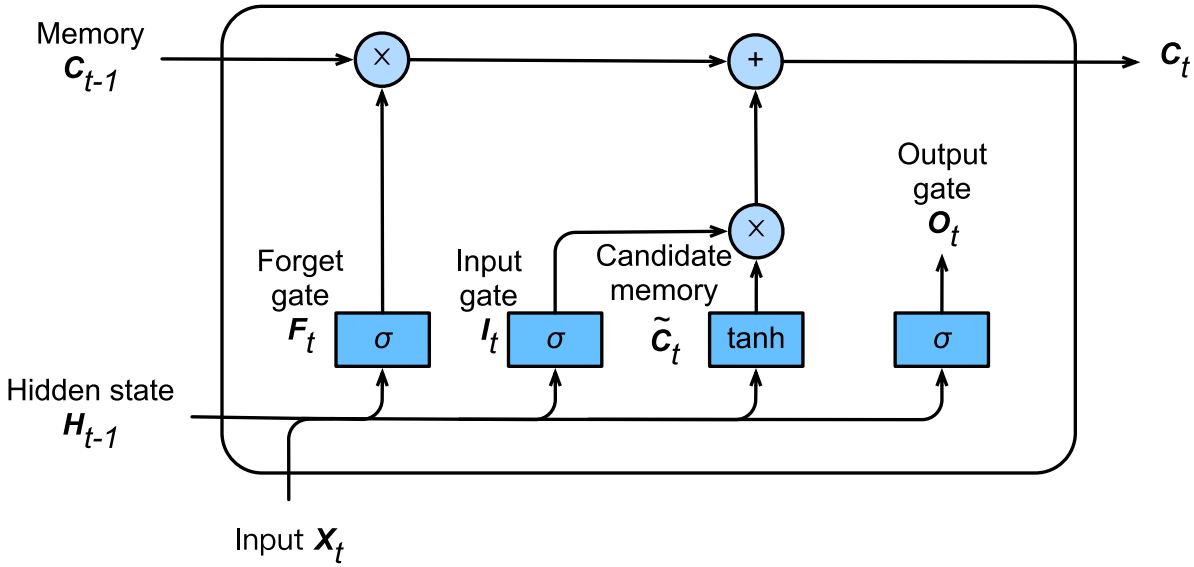
$$\tilde{C}_t = \tanh(X_t W_{xc} + H_{t-1} W_{hc} + b_c)$$



http://amlc-d2l.corp.amazon.com/

Memory Cell

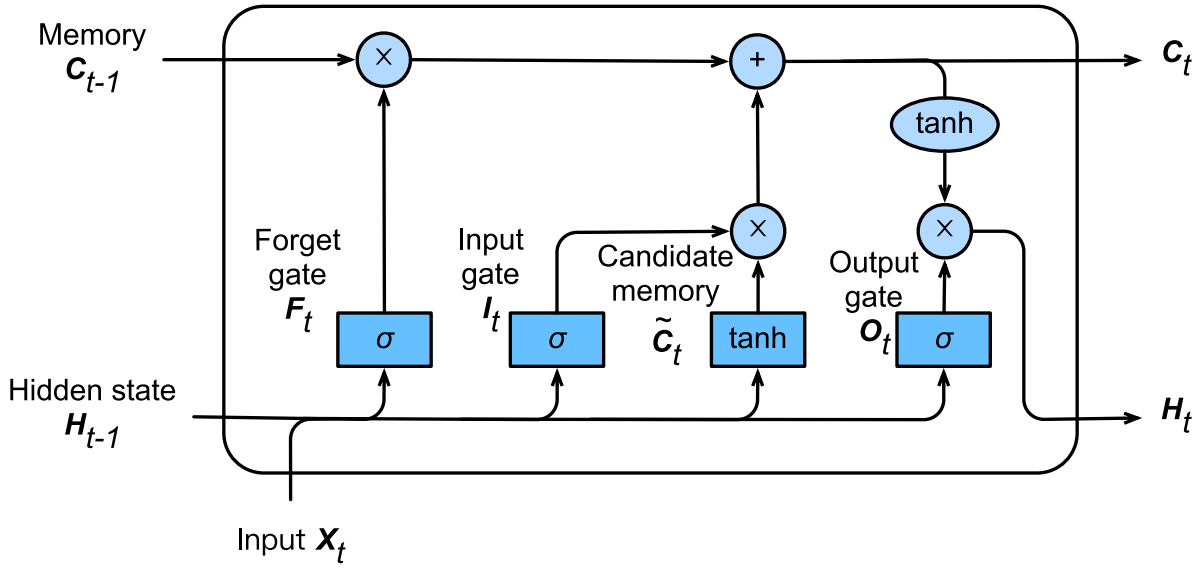
$$C_t = F_t \odot C_{t-1} + I_t \odot \tilde{C}_t$$



http://amlc-d2l.corp.amazon.com/

Hidden State / Output

$$H_t = O_t \odot \tanh(C_t)$$



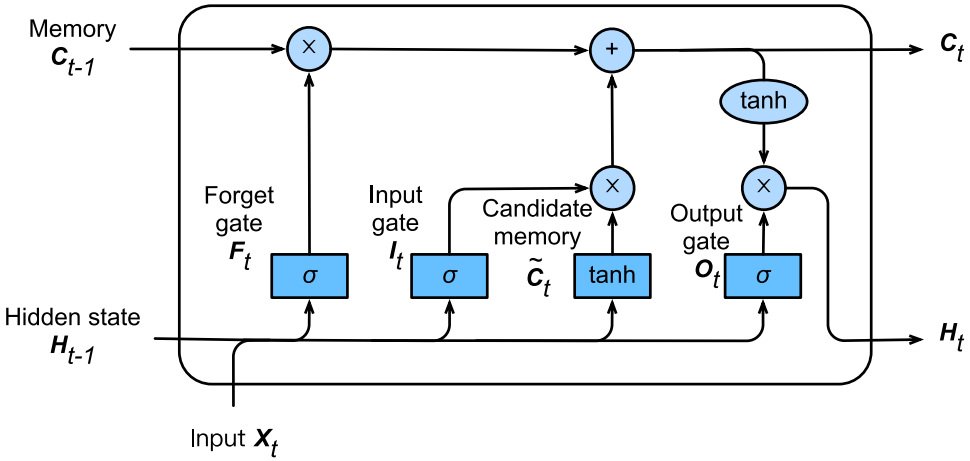
σ FC layer with activation fuction

Element-wise Operator

Copy

Concatenate

Hidden State / Output



$$I_t = \sigma(X_t W_{xi} + H_{t-1} W_{hi} + b_i)$$

$$F_t = \sigma(X_t W_{xf} + H_{t-1} W_{hf} + b_f)$$

$$O_t = \sigma(X_t W_{xo} + H_{t-1} W_{ho} + b_o)$$

$$\tilde{C}_t = \tanh(X_t W_{xc} + H_{t-1} W_{hc} + b_c)$$

$$C_t = F_t \odot C_{t-1} + I_t \odot \tilde{C}_t$$

$$H_t = O_t \odot \tanh(C_t)$$

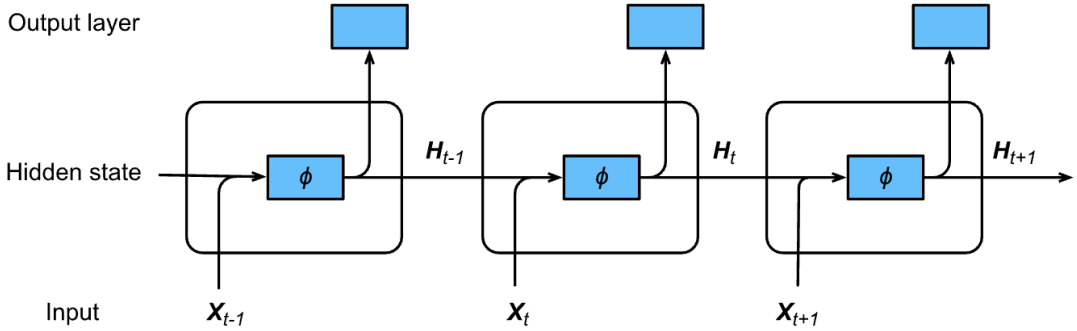
Recall - Recurrent Neural Networks



- Hidden State update

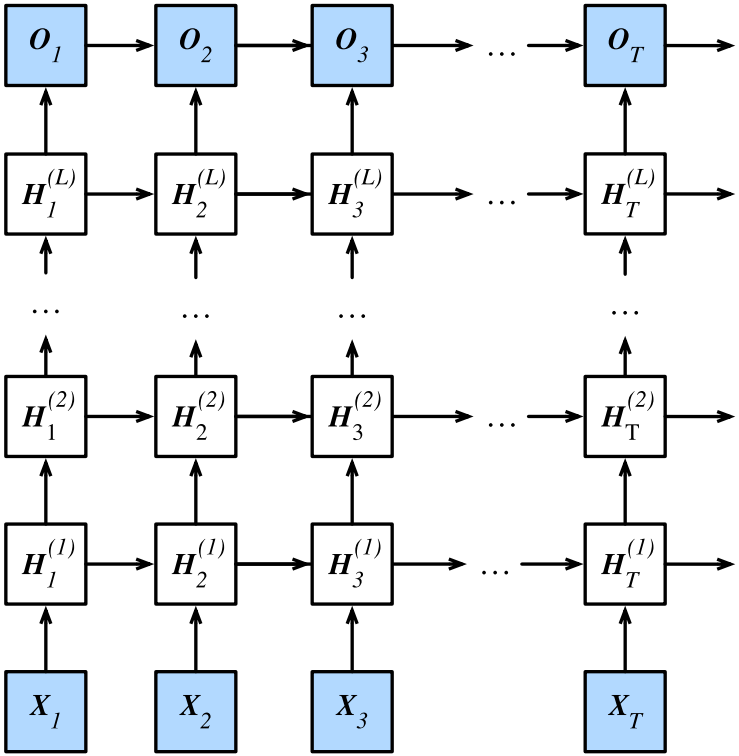
$$\mathbf{H}_t = \phi(\mathbf{W}_{hh}\mathbf{H}_{t-1} + \mathbf{W}_{hx}\mathbf{X}_{t-1} + \mathbf{b}_h)$$

- Observation update

$$\mathbf{o}_t = \mathbf{W}_{ho}\mathbf{H}_t + \mathbf{b}_o$$

How to make more nonlinear?

We go deeper

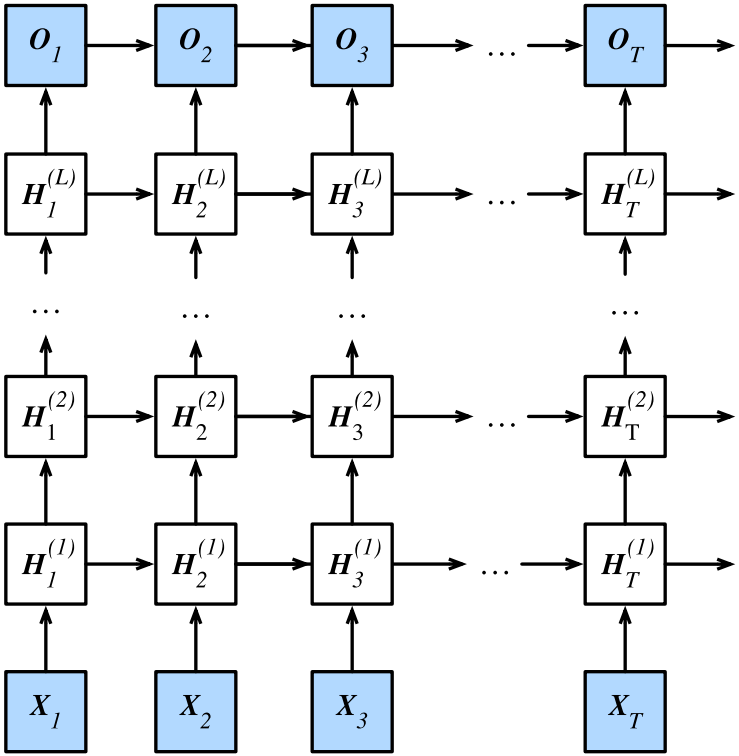


- Shallow RNN
  - Input
  - Hidden layer
  - Output
- Deep RNN
  - Input
  - **Hidden layer**
  - **Hidden layer**
  - …
  - Output

http://amlc-d2l.corp.amazon.com/

aws

Plan B - We go deeper



$$\mathbf{H}_t = f(\mathbf{H}_{t-1}, \mathbf{X}_t)$$
$$\mathbf{O}_t = g(\mathbf{H}_t)$$

$$\mathbf{H}_t^1 = f_1(\mathbf{H}_{t-1}^1, \mathbf{X}_t)$$
$$\mathbf{H}_t^j = f_j(\mathbf{H}_{t-1}^j, \mathbf{H}_t^{j-1})$$
$$\mathbf{O}_t = g(\mathbf{H}_t^L)$$

aws

Bidirectional RNNs

The Future Matters

```
I am _____
I am _____ very hungry,
I am _____ very hungry, I could eat half a pig.
```

http://amlc-d2l.corp.amazon.com/

The Future Matters

```
I am happy.
I am not   very hungry,
I am very  very hungry, I could eat half a pig.
```

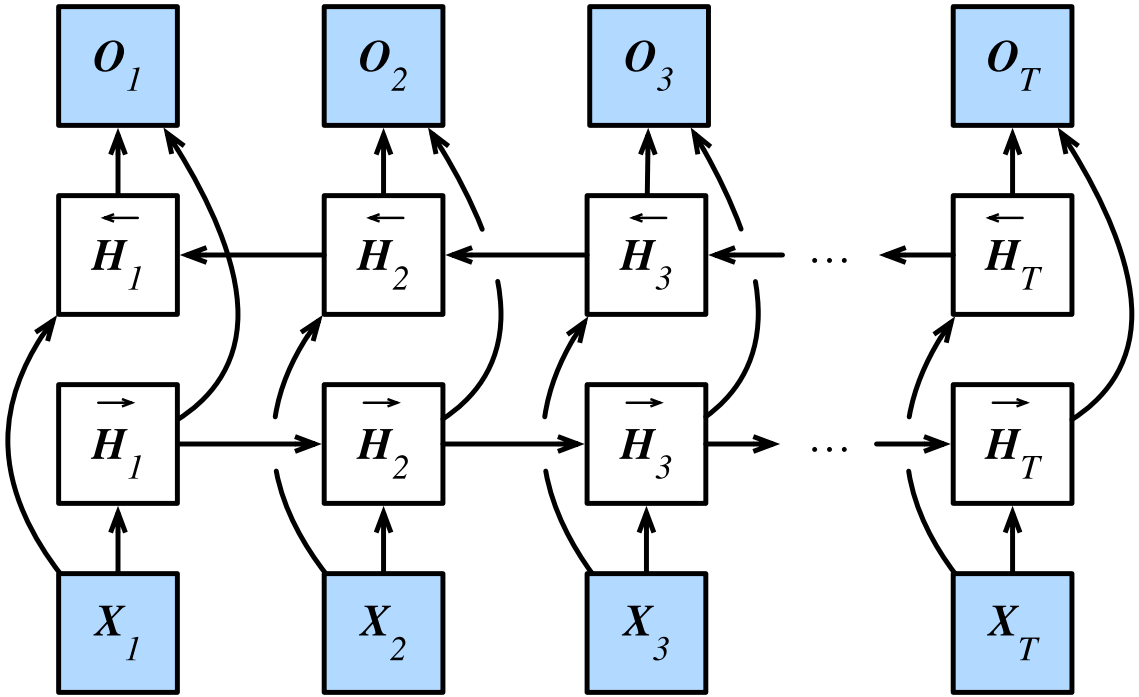
http://amlc-d2l.corp.amazon.com/

The Future Matters

```
I am happy.
I am not   very hungry,
I am very  very hungry, I could eat half a pig.
```

- Very different words to fill in, depending on past and **future** context of a word.
- RNNs so far only look at the past
- In interpolation (fill in) we can use the future, too.

Bidirectional RNN



- One RNN forward
- Another one backward
- Combine both hidden states for output generation

http://amlc-d2l.corp.amazon.com/

```
Perplexity 1.2, 86219 tokens/sec on gpu(0)
time travellererererererererererererererererererererererererer
travellererererererererererererererererererererererererer
```

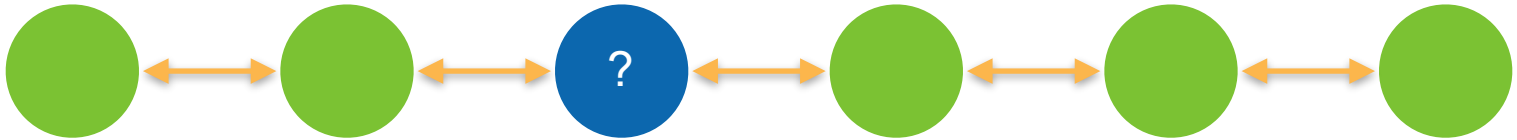
This does not work for sequence generation

http://amlc-d2l.corp.amazon.com/

aws

Reasons

- Training time



- Test time

Can still use it to **encode** the sequence

Summary

- RNN stores sequence information in hidden state
- GRU and LSTM use more sophisticated gates to handle long sequence information
- RNNs can go deeper and bi-directional

http://amlc-d2l.corp.amazon.com/

Math

- Linear algebra
- Prob & statistics
- Gradient

Machine learning

- Loss function
- Regularization
- Model selection
- Environment

Optimization

- Convex Optimization
- Momentum, RMSProp, Adam

Attention

- Seq2seq w/ attention
- Transformer
- BERT

Basic programming

- NDarray
- Autograd
- Gluon

Basic models

- Linear regression
- Image classification
- Softmax regression
- Multilayer perceptron

RNNs and NLP

- Recurrent networks (RNN, GRU, LSTM) for language modeling
- Word embedding
- Seq2seq for machine translation

Performance

- Numerical stability
- multi-GPU Training

CNNs

- Convolution, LeNet
- Alex, VGG, Inception, ResNet

CV

- Data Augmentation
- Fine-tuning
- Object detection
- Segmentation

GAN

- Generative Adversarial Networks
- DCGAN
